INTRODUCTION

Why Take-Home Labs?	viii
Evidence of Success	ix
Inquiry in Chemistry	xi
Providing Feedback to Students	xiv
Tips for Using This Book	xvii
Assembling the Materials	xvii
Master Materials List	xix
Managing the Boxes	xx
Safety Notes	xxi

SECTION 1: Science Process Skills, Measurement and Scientific Inquiry

1. Scavenger Hunt	
Teacher Page	3
Student Page	23
2. Building Your Balance	
Teacher Page	9
Student Page	25
3. Pendulum Lab	
Teacher Page	11
Student Page	27
4. Thickness of Paper Lab	
Teacher Page	13
Student Page	29
5. Graphing the Ball's Bounce	
Teacher Page	15
Student Page	31
6. Investigating an Urban Legend	
Teacher Page	17
Student Page	35
7. The Mole	
Teacher Page	19
Student Page	37
8. Calculating Moles Lab	
Teacher Page	21
Student Page	39

SECTION 2: Chemical and Physical Properties

9. Solutions, Suspensions and Mixtures	
Teacher Page	43
Student Page	101
10. Separation Lab: Elements, Compounds and Mixtures	
Teacher Page	45
Student Page	103
11. Probability of Finding an Electron	
Teacher Page	47
Student Page	105
12. Half-Life Simulation	
Teacher Page	49
Student Page	109
13. Rutherford's Gold Foil Simulation	
Teacher Page	51
Student Page	113
14. Mean Free Path Activity	
Teacher Page	53
Student Page	117
15. Freezing Water	
Teacher Page	55
Student Page	119
16. Surface Tension Lab	
Teacher Page	57
Student Page	121
17. Density of Oil Lab	
Teacher Page	59
Student Page	123
18. Chromatography Lab	
Teacher Page	61
Student Page	125
19. Density Column in a Straw	
Teacher Page	63
Student Page	129
20. Mechanoluminescence: Making Things Light Up	
Teacher Page	65
Student Page	131
21. Intensive and Extensive Properties	
Teacher Page	67
Student Page	133
22. Creating a Colloid	
Teacher Page	69
Student Page	135
23. Average Atomic Mass Simulation	
Teacher Page	71
Student Page	137
24. Reaction Rate	
Teacher Page	73
Student Page	139
25. Molecular Motion and Temperature	
Teacher Page	75
Student Page	141

Contents

26. Boiling Water in a Syringe	
Teacher Page	77
Student Page	143
27. Lifting an Ice Cube With a String	
Teacher Page	79
Student Page	145
28. Chemical Formula Simulations	
Teacher Page	81
Student Page	147
29. Chemical Reaction Simulation	
Teacher Page	83
Student Page	151
30. Balancing Chemical Equations Simulation	
Teacher Page	85
Student Page	155
31. Molecular Shape	
Teacher Page	87
Student Page	159
32. Identifying Types of Streetlights Lab	
Teacher Page	89
Student Page	161
33. Growing Crystals	
Teacher Page	91
Student Page	163
34. Decomposition of Water Lab	
Teacher Page	93
Student Page	165
35. Solubility Lab	
Teacher Page	95
Student Page	167
36. Sea Ice Lab	
Teacher Page	97
Student Page	169
37. Invisible Ink Lab	
Teacher Page	99
Student Page	171

SECTION 3: Chemical Reactions

38. Oxidation Lab	
Teacher Page	175
Student Page	183
39. Synthesis Reaction	
Teacher Page	177
Student Page	185
40. Single Displacement Reaction	
Teacher Page	179
Student Page	187
41. Double Displacement Reaction: Precipitate Lab	
Teacher Page	181
Student Page	189

SECTION 4: Gas Laws, pH and Kinetic Molecular Theory

42. Cartesian Diver Lab	
Teacher Page	193
Student Page	211
43. Pressure Lab	
Teacher Page	195
Student Page	213
44. Boyle's Law Lab	
Teacher Page	197
Student Page	215
45. Finger Thermometer	
Teacher Page	199
Student Page	217
46. Expansion and Contraction	
Teacher Page	201
Student Page	219
47. pH Paper Lab	
Teacher Page	203
Student Page	221
48. Titration Lab	
Teacher Page	205
Student Page	223
49. Redox Reaction Lab	
Teacher Page	207
Student Page	225
50. Adhesion and Cohesion Lab	
Teacher Page	209
Student Page	227
Materials List for Students	231
Duplication Pages	233

INTRODUCTION

Research has shown that homework can be an effective and meaningful learning tool for high school students if it is relevant, engaging and hands-on. These take-home chemistry activities are designed to match those criteria. The activities also cost far less than \$10 per student the first year, and only a small amount each year after to refill the consumables. Educational writer Alfie Kohn said in a 2006 interview that there are only two ways that homework is effective for high school students. One way is using “activities that have to be done at home, such as ... a science experiment in the kitchen” (Oleck 2006). This book is a collection of such activities.

This book is a collection of chemistry labs that lend themselves to being performed at home with simple materials. It is not intended to be a chemistry textbook or to cover every topic encountered in high school chemistry. Most of the labs are written as structured or Level 2 inquiry (see *Inquiry in Chemistry*, page xi), and some include instructions to raise the level of inquiry if the teacher feels comfortable doing so. A few activities just are not compatible with inquiry at home and are written as Level 1 labs but are still important because they introduce topics critical for other experiments or topics that have common misconceptions. Most of the activities involve measuring, graphing, calculating, extrapolating graphs and performing other science-process skills.

Because this is one piece of a complete chemistry curriculum, it is assumed that traditional learning and hands-on activities in the classroom will fill in where take-home labs are not practical. Teachers may choose to eliminate some of the labs and substitute others without breaking the flow of the labs.

Used in this way, the hands-on activities can be a powerful tool for learning chemistry concepts and preparing students for chemistry standardised assessments that are highly dependent on charts, graphs and conceptual questions. These activities have been piloted in schools across the United States and used by teachers who received the material during conference presentations. The success that these teachers have had with the labs helps refute the common misconception among teachers and students that lectures are for learning and labs are for fun. Students *can* learn chemistry from labs.

Although the labs are written as take-home activities for high school students, many of the activities in the book are well suited for homeschooled students as well as those who take online courses. These activities would also be appropriate

for family science nights and museum outreach programs. If a teacher does not have sufficient materials to send an activity home with every student, the lab could be performed in class as an alternative. One teacher used the activities in after-school intervention programs for students who were not proficient after being exposed to the concepts in the classroom.

Why Take-Home Labs?

These take-home labs, if implemented effectively, can address most or all of the following problems, which are common with chemistry labs and homework.

Students will not do homework. This sentiment could be rephrased as, *students will not do busy work at home*. When presented with fun and challenging assignments that open doors to understanding the physical world around them, students will rise to the occasion. Throughout four years of implementing these activities, I found that the homework completion rate improved greatly, and test scores indicate that student achievement increased as well (see Evidence of Success below).

Students do poorly on standardised tests. Most standardised science tests are weighted toward science-process skills. These skills include drawing and interpreting charts and graphs, finding patterns, interpreting diagrams and analysing experimental data. The take-home labs in this book support each of these skills.

There is not enough class time to cover all the standards. A great deal of class time is used on simple labs that students could do at home. These labs are important, but they consume valuable class time. By having students perform these labs at home, teachers recover days of class time in which new concepts can be taught or reinforced.

Students do not experience enough labs. By assigning take-home lab work, teachers can increase the number of labs students complete over the course of the year. This will lead to a more engaging, fulfilling learning experience for students, which will lead to deeper, longer-lasting learning.

Chemistry labs are expensive. There are 50 labs in this book, and the collection of materials needed to complete the labs costs \$10 or less, or approximately 20¢ per lab per student the first year. After the first year, only breakages and consumables need to be replaced, at a cost of less than a dollar per kit.

Chemistry students lack basic skills when they get to my class. Some of the take-home labs teach about background information and skills that students are supposed to remember from middle school but rarely do. These labs are a good refresher that you can refer back to throughout the year. As mentioned earlier, it can also buy you extra days of class time to teach the chemistry curriculum for your grade level.

ACTIVITY 2: BUILDING YOUR BALANCE

Objective

Students learn how to use a single-beam balance to determine the masses of objects. Students use the density of water to determine the mass needed to balance the objects.

Purpose

Students will practice using their balances to hone their skills for future labs.

Materials

Two small cups (takeaway cups for sauces are ideal), plastic ruler, pencil, four coins of differing values

Notes

These balances are surprisingly accurate when used properly. Students should be given the accepted masses of the coins after the lab to determine if they measured properly. They should also be instructed to read the syringe to at least one decimal place. Using a hexagonal pencil will hurt their accuracy a bit, but using a round pencil makes it difficult to get stable balance. There are numerous designs for homemade single-beam balances; feel free to substitute another design if you prefer.

- Five cents: 2.8 g
- Ten cents: 5.6 g
- Twenty cents: 11.2 g
- Fifty cents: 15.5 g
- One dollar: 8.9 g
- Two dollars: 6.5 g

Post-Lab Questions

1. Answers vary.
2. Answers vary but should include suggestions such as the balance shifting, the apparatus not balancing completely, etc.
3. Theoretically, one drop of water; realistically, around the mass of the five-cent piece.

Topic: Density of Water
Go to: www.scilinks.org
Code: THC02

ACTIVITY 2: BUILDING YOUR BALANCE

QUESTION ?

How does a single-beam balance work?

SAFETY

Use only clean water in your syringe. Slowly push the plunger to avoid splashing the water. Never work near an electrical outlet or source. Clean up any spills when finished to avoid slips and falls.

MATERIALS

Two small containers (preferably plastic), plastic ruler, pencil, four coins of differing value

PROCEDURE

You will need a simple balance for many of the activities in this book. To build your balance, you will put a cup on each end of the ruler and balance the ruler on a pencil or pen placed under the middle of the ruler. Attach the cups with tape or glue, then make adjustments in the balance point by adding small extra pieces of tape or clay until the ruler is balanced. When balanced, the ruler may not be perfectly level, but you will be able to tell that tapping it can cause it to sway to either side. When the ruler is not balanced, it will only sway to one side. You should check the empty balance point before each time you use it and make adjustments as necessary. The object that you want to find the mass of should be put in one cup, then you can use the syringe to fill the other cup with water until you have a balance, recording

REPRODUCIBLE

in your lab notebook the beginning and ending volumes in the syringe. Make sure that your balance is on a flat table with both cups over the table. If one side gets too heavy, you do not want the whole balance to fall on the floor.

Remember that the density of water is 1.0 g/ml. That means that 1 ml of water has a mass of 1 g. If it takes 27 ml of water to balance out the sample, then the mass of the sample is 27 g.

This is just one type of simple balance. Other balances might hang from a string or involve other methods. If this one does not work well for you, investigate other methods online and build another type of balance. As long as the balance has a beam that can be balanced with water, it will be fine for all of these activities.

Testing Your Balance

Test your balance by finding the masses of four different coins, and record those masses below. The accepted masses will be given to you by your teacher to ensure that you use the balance correctly.

Data

Value of coin _____

Mass _____ g

Value of coin _____

Mass _____ g

Value of coin _____

Mass _____ g

Value of coin _____

Mass _____ g

Post-Lab Questions

1. What was the percentage difference between your measurement and the accepted mass (as provided by your teacher)? Percent difference = $([\text{difference between the two answers}] \div [\text{accepted answer}]) \times 100$
2. What do you think was the biggest contributor to that difference?
3. What do you think is the lightest mass that you could find using this balance?
